## **VS COMMODORE BODY CONTROL MODULE INFORMATION**

When using scan tools on these models and replacing BCM's there are a few differences to be aware of with the Body control modules on VS Commodores.

### Series I :

This is a standard VS BCM with a 45 minute ignition on manual override procedure. These BCM's do not need to be linked to the PCM.

### Series II :

This is a VS BCM with a 2 hour ignition on manual override procedure. These BCM's also do not need to be linked to the PCM.

### Series III :

These are the last of the VS Utes released. They use a VT Body Control Module which has a 2 hour ignition on manual override procedure. These BCM's need to be linked to the PCM if they are changed.

\* **Note** manual over ride is achieved by keeping the ignition key switched on and the drivers door open for the prescribed time period.
